Hidden Valley
Super Neighborhood

Providing Health Information for Community Action
Introduction

This community health profile highlights important health issues facing the residents of the Hidden Valley Super Neighborhood.

In Houston, a “super neighborhood” is a geographically defined area where residents, civic organizations, institutions and businesses work together to identify, plan, and set priorities to address the needs and concerns of their community. The boundaries of each super neighborhood rely on major physical features such as bayous or freeways to group together contiguous communities that share common physical characteristics, identity or infrastructure. Hidden Valley Super Neighborhood will hereinafter be referred to as “Hidden Valley”.

It is the intention of the Houston Department of Health and Human Services (HDHHS), in developing health profiles such as this, to promote a better understanding by local residents, community-based organizations, community leaders, medical providers, and the public health community of the unique character and circumstances of our various communities, and to draw attention to those matters that contribute to the greatest of health disparities among the citizens of our growing, culturally and ethnically diverse city.

This profile also represents an effort on the part of HDHHS to provide a “baseline” of indicators of health in our communities, against which future trends in conditions can be measured and monitored, and appropriate public health actions, taken.

We hope that this health profile will support these efforts in Hidden Valley and across the City of Houston.

Stephen L. Williams, M.Ed., M.P.A.
Director
Houston Department of Health and Human Services
Community Resources

The health of a community depends to a great extent upon the availability and accessibility of its resources.
Hidden Valley at a Glance

The total population of Hidden Valley was 3,891, according to the 2000 census.*

Age

At the time of the 2000 census, 30% of Hidden Valley residents were under the age of 20. More than half (59%) were between 20 and 64 years of age, and 11% were 65 or older.

Race, Ethnicity, National Origin

Hispanics were the largest racial/ethnic group in Hidden Valley. Whites were the second largest group, comprising 30% of the population. Twenty-six percent of the population were of other races.

Of the total population, 66% were native Texans; 24% were foreign born.

Employment

A large proportion (51%) of Hidden Valley residents, ages 16 and over, were either unemployed or were not in the labor force in 1999.

* Data Source: U.S. Census 2000. Total population was calculated from census block-level data using Summary File 1. For purposes of describing demographics using Summary File 3, the super neighborhood is defined by Census Tract 5335.
Poverty

Only 8% of the population in Hidden Valley was below the poverty level in 1999. Twenty-nine percent of all residents in the super neighborhood had incomes less than twice the poverty level.

Of those living below the poverty level, 39% were children under 18 years of age; 7% were adults 65 and older.

Education

More than one-third (35%) of Hidden Valley residents, ages 25 and over, reported that they had not graduated from high school.

Twenty-eight percent of residents reported a high school diploma (or the equivalent) as their highest level of educational attainment.

Thirty-seven percent of residents had attained education beyond the high school level, with 17% earning a college degree.

Population Stability

More than two-thirds of the residents of Hidden Valley had lived in the same house since 1995. Approximately one-fifth moved to Hidden Valley from other locations in Harris County between 1995 and 1999.

Eight percent of residents moved to the area from outside Harris County between 1995 and 1999.
During the years 1999-2003, the residents of the super neighborhood had a higher overall annual average mortality rate than those of Houston as a whole. However, the mortality rate for heart disease was lower in Hidden Valley than Houston overall.

*Age-adjusted mortality rates: annual average deaths per 100,000 population; census 2000 populations as the denominators; age-adjusted to the 2000 US Standard Million; deaths with known age and disease information. - - Numbers of deaths were too small for rate calculation.
Years of Potential Life Lost (YPLL)

Years of Potential Life Lost (YPLL) is an indicator of premature mortality. This indicator suggests social and economic loss owing to premature death. It also gives information on the specific causes of deaths affecting younger age groups.

$\$ Ranked by Male YPLL Rate

Note: Annual average YPLL rates might be unstable due to small number of premature deaths.

Data Sources: Texas Department of State Health Services, Vital Statistics; US Census, 2000

Differences in YPLL rates between Men and Women, 1999-2003

In Hidden Valley, comparison of leading causes of death among males and females was not possible due to small number of deaths and unreliable rate among females.

Rate of Years of Potential Life Lost (YPLL Rate)

At every age of death, there is a certain number of years of “expected life” that are not lived, and are therefore “lost”. The amount of lost years of life often differ by cause of death. Many people consider death before the age of 65 years as premature. In this community, more years of life were lost prematurely due to heart disease, accidents, and cancer related deaths than any other causes.

Comparison of age-adjusted YPLL rates was not possible because of the relatively small number of deaths (less than 5) occurring before age 65 in Hidden Valley.

NOTE: Special cause of death categories may not be mutually exclusive.

d Crude annual average YPLL per 100,000 population under age 65 years.
** Age-adjusted annual average YPLL per 100,000 population under age of 65, standardized for 2000 US Standard Million.
- - Number of deaths too small for age-adjustment.
- Houston data not presented because comparison data were not available for the community.
Maternal and Child Health

Prenatal care is the care a woman gets during pregnancy. Both prenatal care and birth weight are good indicators of a newborn’s chances of survival, growth, long term health, and psycho-social development.

Entry into Prenatal Care by Trimester of Pregnancy, 1999-2003

A higher proportion of White women (81.5%) than Hispanic (76.7%) and Black (74.0%) women in Hidden Valley entered prenatal care during the first trimester. A small proportion of women in all groups entered prenatal care very late in their pregnancy, or received no care at all.

Low Birth Weight Births (LBWB), 1999-2003

Approximately 7% of live births in Hidden Valley were of low birth weight (2500 grams or less), which was slightly lower than Houston as a whole. Both were above the Healthy People 2010 goal of less than 5% of live births being low weight.

Low birth weight is a factor significantly related to infant mortality. Infants born with low birth weights are at increased risk for serious health problems and long term disabilities such as mental retardation, cerebral palsy, and respiratory, vision, and hearing problems. Low birth weight and infant mortality are therefore among the most important indicators of a community’s health.

Data Source: Texas Department of State Health Services, Vital Statistics, 1999-2003
Teenage childbearing is associated with negative consequences for the children born of teen mothers. In addition, there are important social and economic costs to individuals as well as the society as a result of births to teenage mothers.

Births by Age of Mother, 1999-2003

A total of 276 births were recorded over the period 1999-2003 among mothers in Hidden Valley. One out of every 7 of these births was to a young mother (15-19 years of age).

Births to Teen Mothers, 1999-2003

The annual average birth rate for 15-17 year-old teens in Hidden Valley (34.3 per 1,000 females aged 15 to 17 years) was 29% lower than the rate in Houston overall. The birth rate among 18-19 year-old females in Hidden Valley was 47% lower than the total Houston rate.

Births to Teen Mothers by Super Neighborhood, 1999-2003

Hidden Valley was among the neighborhoods in Houston with the lowest annual average rates of births to teen mothers (15-17 years of age).
Infant Mortality

Infant mortality annual average rate is the death of infants in the first year of life. It is one of the most important indicators of the health of a community. The Healthy People 2010 goal is to eliminate disparities among racial and ethnic groups with infant mortality rates (IMR) above the national average. The targeted groups are African American, American Indian, Alaskan Native and Puerto Rican populations.

Infant Mortality Rate, 1999-2003

The infant mortality rate for this community was not reported due to small number of infant deaths.

Infant Mortality Rate by Super Neighborhood 1999-2003

Hidden Valley was among the neighborhoods with the lowest numbers of infant deaths.

Data Source: Texas Department of State Health Services, Vital Statistics
Leading Causes of Hospitalization

In Hidden Valley, during the years 1999-2002, the most common causes of hospitalization were related to cardiovascular and cerebrovascular diseases, issues of childbirth and perinatal period conditions, digestive disorders, or injury and poisoning.

Note that only the most common conditions are listed under each major category of diagnosis, and that the sum of these counts may not equal the total counts for the category.

Data Source: Texas Department of State Health Services, Texas Health Care Information Collection
The crime rate in urban areas is of concern to the residents, law enforcement and the local government. Crimes place stress on the residents of neighborhoods and affect their well-being. Of particular concern are violent crimes that threaten residents’ lives, such as those involving firearms.

**Overview of Crime, 1999-2003**

**Crime in Hidden Valley**

- Violent Crime: 9%
- Narcotic Drug Law Related: 2%
- Alcohol Related: <1%
- Burglary: 8%
- Other Assaults: 9%
- Other Crime: 72%

**Crime in Houston**

- Violent Crime: 9%
- Narcotic Drug Law Related: 4%
- Alcohol Related: 1%
- Burglary: 10%
- Other Assaults: 14%
- Other Crime: 62%

**Violent Crime, 1999-2003**

The annual average rate of violent crime in Hidden Valley was 12.1 per 1,000 population, slightly higher than the Houston rate as a whole. The firearm-related violent crime rate in Hidden Valley was 5.3 per 1,000 population, 23% higher than the rate in Houston overall.

**Rate of Violent Crime by Super Neighborhood, 1999-2003**

Hidden Valley was among the neighborhoods with elevated annual average rates of violent crime in the city.

---

Data Source: Houston Police Department
Tuberculosis

Tuberculosis (TB) is caused by a specific type of bacteria that spreads from person to person through the air. TB typically affects the lungs but can also affect the brain and other organs. If this disease is left untreated it can be fatal.

From 1999 to 2003, fewer than 5 newly-acquired cases of tuberculosis were identified among residents of Hidden Valley.

Data Source: HDHHS, Bureau of TB Control

Drowning and Submersion

Drowning and submersion injuries are often unintentional and are preventable through increased awareness of precautions that can be taken in and around bodies of water.

Fewer than 5 drowning or submersion cases were reported among Hidden Valley residents from 1999-2003.

Data Source: HDHHS, Bureau of Epidemiology

Food-borne Diseases

Many food-related diseases are easily preventable. Eating well-cooked foods, keeping cooking areas free of contamination by thoroughly cleaning surfaces touched by raw meats and poultry, hand washing before handling food, and avoiding unpasteurized products are some of the measures that people can take to lower their risk of food-related disease.

Food-related diseases are typically under-reported. It is likely that many more cases occurred from 1999 to 2003 than were actually reported to health officials.

Chemical emissions and waste released into the air, soil, and water can affect everyone. Knowing the locations and types of potential polluters allows residents to better monitor the potential environmental impact on their communities.

**Regulated Facilities**

The Environmental Protection Agency (EPA) and the Texas Commission on Environmental Quality (TCEQ) administer programs which monitor and regulate facilities with the potential to release significant amounts of hazardous chemicals to the environment.

Within one mile of Hidden Valley, there are 3 Toxic Release Inventory (TRI) reporting facilities.

These facilities are regulated under one or more of the following federal statutes: the Emergency Planning and Community Right-to-Know Act (EPCRA), the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), the Resource Conservation and Recovery Act (RCRA), the Clean Air Act, and the Clean Water Act.

The EPA provides reports concerning federally regulated facilities through an online application called Envirofacts (www.epa.gov/enviro/index.html).

**Type of Regulated Facility**

- Toxic Release Inventory (TRI) Facilities: 302
- Major Storm Water Runoff Facilities: 56
- Hazardous Waste Treatment, Storage, or Disposal (TSD) Facilities: 35
- Large Quantity Generators (LQG) of Hazardous Waste: 132
- Radioactive Waste Sites: 4
- Current Superfund Sites: 12
- Former Superfund Sites: 5
- Active Landfills: 9
- Inactive Landfills: 2
- Closed Landfills: 18

**Data Sources:**
Environmental Protection Agency; Texas Commission on Environmental Quality
HIV/AIDS

HIV (Human Immunodeficiency virus) attacks the immune system and can progress to Acquired Immune Deficiency Syndrome (AIDS). HIV is primarily transmitted through unprotected sex or sharing needles with someone infected with the virus. It can also be transmitted before or during birth and from breast milk from mother to child. Many of those infected are unaware of their HIV status, and therefore can transmit the disease unknowingly.

New HIV Diagnosis Rate, 1999-2003

The annual average rate of new HIV diagnosis in the zip code 77088 (which includes Hidden Valley) was slightly higher than the Houston-wide rate during the period 1999-2003; the rate of 69.1 cases per 100,000 population was far above the Healthy People 2010 goal of less than 1 new case per 100,000 population.

HIV Risk Factors, 1999-2003

Fifty-seven percent of new HIV infections occurred in males in Hidden Valley. In almost one-third of all cases, the mode of transmission was unknown. Heterosexual contact accounted for about 44% of all reported cases. This was followed by male-to-male sex (13%) and use of IV drugs (8%). Three percent of new infections occurred in those reporting male-to-male sex and IV drug use.

Rates of New HIV Diagnosis by Zip Code*, 1999-2003

The annual average rate of new HIV diagnosis in zip code 77008 was higher than that of many other zip codes in the city.

* Annual average rates are calculated only for those zip codes that lie predominantly within the boundaries of the city of Houston.
Gonorrhea

Gonorrhea is a sexually transmitted disease (STD) caused by bacteria. If untreated, it can cause serious and permanent health problems in both women and men. It also places infected persons at greater risk for HIV. Though rare, it can result in death if untreated.

New Gonorrhea Infection by Age, Sex, Race/Ethnicity

The annual average rate of new gonorrhea cases in Hidden Valley was 17% lower than the rate in Houston overall; both rates were much greater than the Healthy People 2010 goal of less than 19 cases per 100,000 population.

Gonorrhea Infection by Age, Sex, Race/Ethnicity

Blacks, who represent 18% of Hidden Valley's population, accounted for 67% of new cases. More than half (63%) of all cases occurred in males, and persons aged 20-29 years accounted for the majority of all cases.

Rates of Gonorrhea Infection by Super Neighborhood, 1999-2003

Hidden Valley was among those neighborhoods with the lowest annual average rates of infection.
Syphilis

Syphilis is a sexually transmitted disease (STD) and is passed from person to person through direct contact with a syphilis sore. Sores occur mainly on the external genitals, vagina, anus, or in the rectum. Transmission occurs due to unprotected sex. The sores may also occur in lips and mouth. Untreated syphilis can progress into more serious conditions affecting the nervous system, heart and other organs, seriously impairing health.

Rates of New Syphilis Infection, 1999-2003

Due to few cases of syphilis in Hidden Valley from 1999-2003, the rate was unreliable and is not reported.

Rates of Syphilis by Super Neighborhood, 1999-2003

Hidden Valley was among the neighborhoods with the lowest numbers of new cases.

Data Source: HDHHS Bureau of Epidemiology
Chlamydia

Chlamydia is the most frequently reported sexually transmitted disease (STD) in the nation. Women are more commonly screened for the infection than are men, and those 15 to 24 years of age appear to be the most affected, nation-wide. The symptoms are usually mild and not easily recognized, causing many with the infection not to seek treatment. If untreated, chlamydia can cause infertility in women.

Rates of Chlamydia, 1999-2003

The annual average rate of chlamydia infection in Hidden Valley was 308 per 100,000 population, slightly higher than the rate in Houston overall. Although Black women between the ages of 15 and 24 years had the highest rate of infection in Hidden Valley, this rate was 12% lower than that of the same group in Houston overall.

Chlamydia Infection By Age, Sex, and Race/Ethnicity, 1999-2003

Almost half of all cases in Hidden Valley occurred among Hispanics, and seventy-eight percent of all cases were female. Persons aged 20-29 years accounted for nearly half (48%) of all cases.

Rates of Chlamydia by Super Neighborhood, 1999-2003

Hidden Valley was among the neighborhoods with elevated annual average rates of infection.

Data Source: HDHHS Bureau of Epidemiology
Technical Notes
The Community Health Profiles Project attempts to provide the most recent statistical information available on the health of communities. The 1999-2003 series represents a “baseline” against which changes in the health indicators of communities can be evaluated over time. Data used to compile this profile are derived from a variety of sources — local, state, and national. These data sources may collect information on different cycles and therefore gaps in available years of data may be observed within a single profile.

Except where noted otherwise, rates are calculated using 2000 census data for each community, including age, race, and sex distributions. Agreement between race/ethnicity classifications in the data used in this report and those derived from the census is imperfect; disease registries do not uniformly capture ethnicity along with race and categories of “Black”, “White,” “Asian,” and “Other” may overlap with “Hispanic” ethnicity. Despite potential overlap, in this profile, “Black” is meant as “non-Hispanic Black,” “White” as “non-Hispanic White,” and “Hispanic” as being persons of any race and of Hispanic/Latino culture and origin. The profiles group a range of years of data and present them, where most appropriate, as annual average incidence of the indicator. If the total number of events is less than five, the associated rate is considered unreliable and is not reported; however for Leading Causes of Death, the minimum number of deaths for reporting age-adjusted rates is set at 25. Statistics presented in profiles of super neighborhoods, medically-underserved areas (MUAs), and other geographies are based upon successful geocoding of the residence of individual cases within the boundaries of those geographic entities. The denominator in all cases is the year 2000 census, as the estimated “average” population for each year of the analysis period. Background Houston rates and Healthy People 2010 goals have been used for most indicators as a standard for comparison.

Mortality data: Mortality data have been obtained at the address level from the Texas Department of State Health Services for 1999-2003. The YPLL statistics are computed using 65 years of age as the end point. Crime data: Data for 1999-2003 have been acquired from the Houston Police Department at the address level of the site of the incident. HIV/AIDS data: As of this report, data were only available at the zip code level.

Other notes
Data for a number of additional indicators considered important for a community’s assessment of its health and health planning efforts were not available at the time of printing of this document. These indicators, including various injury indicators, and more community-specific behavioral data are being collected or researched for potential inclusion in the future published version of this report.
About Community Health Statistics (CHS)

Community Health Statistics (CHS) is a program within the division of the Office of Surveillance and Public Health Preparedness of the Houston Department of Health and Human Services (HDHHS). It is comprised of epidemiologists, statisticians, and GIS analysts who acquire data through collaboration with multiple partners within and outside the department for analysis, interpretation, and sharing of information on local health issues.

Our mission is to serve the needs of HDHHS, and the needs of the scientific community, and general public as a resource for data and information on the indicators and the determinants of the health and well-being of geographically-defined communities, as well as of other distinct population groups within the city of Houston, Texas.
