

COMPOSTING

SUSTAINABLE LIVING GUIDE

Compost is decomposed plant material that is used to organically replenish nutrients in the garden soil.

Composting reduces the amount of food waste sent to landfills and creates an excellent (and free) source of garden and plant amendments for your yard.

Compost is decomposed plant material that is used to organically replenish nutrients in the garden soil.

COMPOST IS AS EASY AS 1-2-3-4

1

Start with 6 inches of course brown materials like dried leaves and newspaper clipping.

2

Add a 2 inch layer of green matter, like kitchen scraps and grass clippings, maintaining a 3:1 ratio of brown to green matter.

3

Sprinkle with ground soil or other compost to introduce your microbes and bacteria. Repeat layers ending with brown matter.

4

Your pile should feel like a wet sponge. Moisten with water if its too dry; add brown matter if it is too wet.
